Precision and Care: A Journey through Our Watch Servicing

Process

Let me state here that at WeFixAnyWatch, we hold our approach to [watch service](#) in the highest regard.

Our professional organizational team of watchmakers strictly follows a definite procedure to refurbish and restore the look of various timepieces to their former selves. They include having to disassemble the movement, wash the parts, reassemble the movement, and quality assurance; every process is done diligently and cautiously.

1st Step

1st Step

Dismantling the Watch

The first process in servicing the watch involves removing the movement, dial, and hands from the casing. Also, the bracelet or the strap is removable to enable the checking and servicing of every part separately.

2nd Step

2nd Step

Stripping Down and Cleaning the Movement

Then, having divided the movement, only experienced watchmakers separate it into components, one by one. This disassembly allows for cleaning hard-to-reach areas and every corner throughout the vehicle. The whole part is then washed by hand in a special solution to remove dirt and other deposits that exist on the part.

3rd Step

3rd Step

Cleaning in Watch Cleaning Machine

To ensure a highly standard level of cleanness, the dismantled parts are arranged in baskets and passed through our modern watch cleaning equipment. This machine uses various kinds of cleaning fluids to achieve total and fast cleaning and remove any remnants of dirt.

4th Step

4th Step

Examination and Component Replacement

After the cleaning stage, every movement component passes through a meticulous examination. Our watchmakers look for signs of wear or buckle damage on the straps. The components that are worn are immediately replaced to guarantee the durability and reliability of the timepiece.

5th Step

5th Step

Careful Reassembly and Lubrication

Having received cleaned and inspected components, our experienced watchmakers proceed to one of the most delicate parts of the work – the assembling of the movement. Some caution must be exercised in ensuring that the contact surfaces have been adequately lubricated when, as herecommended, lubricants must be used in this stage. This process could provide maximumperformance and durability for movement in the future.

6th Step

6th Step

Checking and Adjusting the Movement

They are accurate and reassembled after a close examination and some modifications. Our watchmakers carefully examine the respective movements' rates and parameters to match some predefined quality criteria. Any necessary change is performed depending on the optimal need of the watch's timekeeping.

7th Step

7th Step

Cleaning and Restoration of the Case and Bracelet

Though the movement gets extensive coverage, we also take our time to refurbish the outer look of the watch. The case and bracelet are brought through an immaculate washing process, leaving the surfaces smooth and free of deposits. When it comes to specific brands, we use specific methods to revive that shine on the face to conserve the authenticity and the structure of the funder tool known as a timepiece.

8th Step

8th Step

Reassembly, Gasket Inspection, and Water Testing

After a watch has been cleaned to the degree that is necessary and or safe, after its parts have been

restored, if that is necessary, the watch is then carefully put back together. Our watchmakers then double-check the gaskets before they can go on the watches to check the overall health of the gaskets. To meet the water resistance criteria, the watch goes through various tests to ensure that it meets the specifications.

9th Step

9th Step

Quality Control and Timekeeping Testing

Before the servicing process, all watches are subjected to rigorous scrutinizing quality assurance measures. As a team, it is standard that each watch component is analyzed, and there is evidence that all necessary repairs/repairs and settings of the watch have been performed to the optimal level. The performance ability is also tested in terms of timekeeping to establish that such an aspect is correct.

10th Step

10th Step

Visual Inspection and Auto-Winder Testing

Last of all, our quality control department performs a visually exhaustive examination of all pieces for watches, guaranteeing compliance with the highest quality rates. Also, the automatic watches are put on an auto-winder to test the movements rigorously as they are used on the wrist.

Dismantling the Watch

The initial step in our watch servicing process involves the careful removal of the movement, along with the dial and hands, from the case. Additionally, the bracelet or strap is detached to allow for a thorough component.

Stripping Down and Cleaning the Movement:

Once the movement is separated, our skilled watchmakers meticulously strip it down into its individual components, allowing us to access every nook and cranny for a thorough cleaning. Each component is then cleaned using a specialised solution, ensuring the removal of accumulated dirt and grime.

Cleaning in Watch Cleaning Machine:

To achieve an impeccable level of cleanliness, the dismantled parts are carefully placed in baskets and introduced to our state-of-the-art watch-cleaning machine. This machine employs different cleaning fluids, allowing for a comprehensive and efficient cleaning process, ensuring the removal of any remaining impurities.

Examination and Component Replacement

After the cleaning stage, each individual part of the movement undergoes a meticulous examination. Our watchmakers closely inspect for any signs of wear or damage. Worn components are promptly replaced, ensuring the longevity and reliability of the timepiece.

Careful Reassembly and Lubrication

With the cleaned and inspected components at hand, our skilled watchmakers embark on the intricate process of reassembling the movement. During this stage, strict attention is paid to lubricating the contact points using lubricants recommended by the manufacturer. This critical step guarantees optimal performance and durability of the movement in the long run.

Checking and Adjusting the Movement

The reassembled movement undergoes meticulous checks and adjustments to ensure its accuracy. We use precision instruments, ensuring they align with the brand's standards to optimize the timekeeping performance.

Cleaning and Restoration of the Case and Bracelet

While the movement receives thorough attention, we also focus on restoring the external aesthetics of the watch case and bracelet.

the watch. The case and bracelet undergo a meticulous cleaning process, eliminating all traces of dirt and grime. For luxury watch brands, we employ specialised techniques to restore the shine, preserving the integrity and value of the timepiece.

Reassembly, Gasket Inspection, and Water Testing

Once the cleaning and restoration stages are complete, the watch is carefully reassembled. Our watchmakers conduct a detailed inspection of the gaskets, ensuring they are in optimal condition. To verify the watch's water resistance, it undergoes rigorous testing, ensuring compliance with specifications.

Quality Control and Timekeeping Testing

Prior to finalising the servicing process, all watches undergo a stringent quality control procedure. Our team meticulously assesses every aspect of the watch, ensuring that all repairs and adjustments have been completed to the highest standards. Timekeeping accuracy is also tested to guarantee optimal performance.

default watermark

Visual Inspection and Auto-Winder Testing

As a final step, all watches undergo a comprehensive visual inspection, ensuring that every detail meets our meticulous standards. Additionally, automatic watches are placed on an auto-winder for testing, simulating regular wrist movement to ensure optimal functionality.
